Summary

Brian Philippus is an IT Professional with over 28 years of experience leading and managing the design, implementation, and maintenance of both “home-grown” and “off-the-shelf” software packages. He has extensive experience in web-based and client server applications as well as pure integrations between packages.

Experience

Midamerican Energy Company, Manager, Applications Development

Spearheaded the strategic consolidation of cross-functional software engineering and business analysis teams from three separate affiliates into a unified, high-performing organization. Directed the modernization of legacy .NET architecture by architecting a migration to Kubernetes, successfully offloading infrastructure management while enhancing system high availability. Oversee a diverse portfolio of complex in-house and vendor-managed systems, ensuring 24/7 reliability and the timely delivery of secure technical solutions in a high-demand, customer-centric environment.

I maintain a culture of high performance by personally driving project ownership and following through with stakeholders to ensure seamless delivery of business priorities.

Key responsibilities include:

- Managing and mentoring a large IT team
- Driving the development, planning, and execution of IT and business projects
- Solving complex, mission-critical problems with creative solutions
- Overseeing tier-one business-critical applications
- Shaping and executing IT strategy, policy, and standards.
- Building strong relationships with vendors and stakeholders

Sept 2025 – present

1 year

NV Energy, Solutions Architect

Technical lead for the implementation of the Oracle Utilities Network Management System (NMS), an advanced distribution management system and critical infrastructure for the company.

- Ensured that vendors aligned with the company long term strategy and roadmap as well as compliance and technical requirements.
- Coordinated and collaborated with internal teams to facilitate the implementation of the Oracle NMS while ensuring that the processes are properly documented and repeatable.
- Creating and managing IT architecture models and solution patterns that align with the company’s technology strategies and governance standards

June 2024 – Sept 2025

1 year 4 months

NV Energy, Senior Platform Engineer

Strategic Technical Lead who architected and managed high-availability platform environments for mission-critical web and mobile applications. Spearheaded DevOps transformation by implementing CI/CD pipelines using Concourse and Jenkins and streamlining operations through extensive Ansible automation. Led cross-functional teams of 6–12 engineers and contractors, prioritizing workstreams and removing technical blockers to ensure consistent delivery of enterprise goals.

Directed the management of containerized workloads across Docker, Tanzu Application Server, and Tanzu Kubernetes Grid. Collaborated closely with IT and business leadership to define infrastructure vision, execute complex RFP processes for hardware/software replacement, and maintain 24/7 system reliability. Ensured rigorous operational excellence through disciplined incident management, root-cause analysis, and strict adherence to security and regulatory compliance frameworks, including SOX.

Apr 2017 – June 2024

7 years 3 months

NV Energy, Senior Software Engineer

Contributed 19 years of technical expertise across two specialized teams: 12 years delivering custom internal corporate applications via Rapid Application Development (RAD) and 7 years architecting enterprise-scale integrations using both synchronous (request-response) and asynchronous (batch) methodologies.

Provided advanced technical expertise and guidance in the architecture, design, and implementation of complex enterprise systems. I served as a technical lead for high-stakes projects, directing cross-functional teams of engineers and contractors while managing project budgets and establishing secure development patterns. My tenure involved architecting robust, fault-tolerant integration solutions for mission-critical initiatives—such as the company's first Smart Grid deployment—using Java, XSLT, and IBM middleware to bridge large-scale, disconnected systems.
